

Printhead cleaning features

Simple and easy to use cleaning system to keep the printhead in top condition

inkanto® ribbons come with 2 complementary printhead cleaning features.

Clean Start®

A built-in ribbon feature that ensures regular printhead cleaning

Cleaning Wipe

A free wipe in every box for a deeper printhead clean-up

The printhead is the most expensive part of the printer, so preventive and regular cleaning protects against premature printhead failure and poor print quality.

1. Maintain print quality

Dust and particle build-up can limit the heating capacity of the dots on the printhead. It will result in partial or no transfer of the ink altering the print quality and the read/scan capability.

Ensure consistent print quality with efficient and easy-to-use features.

2. Reduce production downtime

When the printhead must get a deep clean, the printer must be stopped which has a direct impact on a production line productivity.

Reduce the unnecessary cleaning stops with regular preventive cleaning.

3. Prevent costly printhead replacement

When dust and particles build up on the printhead, it will require an increase of printhead energy to ensure a quality ink transfer. Higher demand on the printhead will speed its aging and replacement.

Reduce the frequency of costly printhead replacements.

Clean Start[®] + cleaning wipe: the strong power duo

Clean Start[®]

Clean Start is a thin white film coated with a mild cleanser, added to the beginning of every inkanto 1" flat-head roll.

In just 5 easy steps, it helps remove debris and residue from the printhead before starting the next print batch.

Cleaning Wipe

It is a highly tear resistant, non-woven material soaked with a 99% alcohol solution for efficient cleaning and fast drying.

There is a free wipe in every box of inkanto rolls. They can also be ordered in a box of 50 wipes.

Watch Clean Start in action >

Clean Start cleans the surface covered by the ribbon width >>>

The cleaning wipe can clean the entire width of the printhead, not just the printing width.

Clean Start cleans the line of heating dots that are in contact with the ribbon >>>

The cleaning wipe will clean all the printhead ceramic, including all heating dots.

Clean Start ensures a regular cleaning with every ribbon change >>>

The cleaning wipe complements with a deeper cleaning method for every new box of ribbons.
